Dashboard / My courses / PSPP/PUP / Experiments based on Tuples, Sets and its operations / Week7_Coding

Started on	Thursday, 6 June 2024, 1:20 PM
State	Finished
Completed on	Friday, 7 June 2024, 8:39 PM
Time taken	1 day 7 hours
Marks	5.00/5.00
Grade	100.00 out of 100.00

```
Question 1
Correct
Mark 1.00 out of 1.00
```

Given an array of integers nums containing n + 1 integers where each integer is in the range [1, n] inclusive. There is only **one repeated** number in nums, return this repeated number. Solve the problem using \underline{set} .

Example 1:

Input: nums = [1,3,4,2,2]

Output: 2

Example 2:

Input: nums = [3,1,3,4,2]

Output: 3

For example:

Input					Result
1	3	4	4	2	4

Answer: (penalty regime: 0 %)

```
def find_duplicate(nums):
    visited=set()
    for num in nums:
        if num in visited:
            return num
        visited.add(num)
num=[int(x)for x in input().split()]
print(find_duplicate(num))
```

	Input	Expected	Got	
~	1 3 4 4 2	4	4	~
~	1 2 2 3 4 5 6 7	2	2	~

Passed all tests! 🗸

Correct

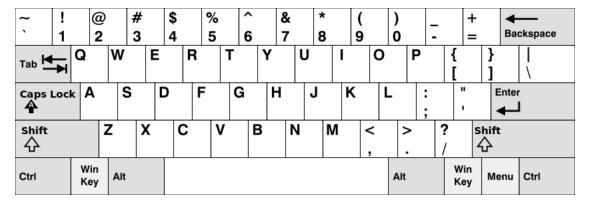

Marks for this submission: 1.00/1.00.

```
Question 2
Correct
Mark 1.00 out of 1.00
```

Given an array of <u>strings</u> words, return the words that can be typed using letters of the alphabet on only one row of American keyboard like the image below.

In the American keyboard:

- the first row consists of the characters "qwertyuiop",
- the second row consists of the characters "asdfghjkl", and
- the third row consists of the characters "zxcvbnm".

Example 1:

```
Input: words = ["Hello","Alaska","Dad","Peace"]
Output: ["Alaska","Dad"]
```

Example 2:

```
Input: words = ["omk"]
Output: []
```

Example 3:

```
Input: words = ["adsdf","sfd"]
Output: ["adsdf","sfd"]
```

For example:

Input	Result
4	Alaska
Hello	Dad
Alaska	
Dad	
Peace	
2	adsfd
adsfd	afd
afd	

Answer: (penalty regime: 0 %)

```
k={'q':1,'w':1,'e':1,'r':1,'t':1,'y':1,'u':1,'i':1,'o':1,'p':1,
'a':2,'s':2,'d':2,'f':2,'g':2,'h':2,'j':2,'k':2,'l':2,
'z':3,'x':3,'c':3,'v':3,'b':3,'n':3,'m':3}
a=int(input())
1=[]
for i in range(a):
   b=(input())
   l.append(b)
r=[]
for i in 1:
  if len(set(k[c.lower()]for c in i))==1:
       r.append(i)
for j in r:
  print(j)
if r==[]
   print('No words')
```

	Input	Expected	Got	
~	4 Hello Alaska Dad Peace	Alaska Dad	Alaska Dad	~
~	1 omk	No words	No words	~
~	2 adsfd afd	adsfd afd	adsfd afd	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

```
Question 3
Correct
Mark 1.00 out of 1.00
```

There is a malfunctioning keyboard where some letter keys do not work. All other keys on the keyboard work properly.

Given a string text of words separated by a single space (no leading or trailing spaces) and a string brokenLetters of all distinct letter keys that are broken, return the number of words in text you can fully type using this keyboard.

Example 1:

Input: text = "hello world", brokenLetters = "ad"

Output:

1

Explanation: We cannot type "world" because the 'd' key is broken.

For example:

Input	Result
hello world ad	1
Faculty Upskilling in Python Programming ak	2

Answer: (penalty regime: 0 %)

```
a=input()
a=a.lower()
b=input()
c=""
for i in a:
    if(i in b):
        c+=i
c=set(c)
print(len(c))
```

	Input	Expected	Got	
~	hello world ad	1	1	~
~	Welcome to REC e	1	1	~
~	Faculty Upskilling in Python Programming ak	2	2	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.

```
Question 4
Correct
Mark 1.00 out of 1.00
```

Write a program to eliminate the common elements in the given 2 arrays and print only the non-repeating elements and the total number of such non-repeating elements.

Input Format:

The first line contains space-separated values, denoting the size of the two arrays in integer format respectively.

The next two lines contain the space-separated integer arrays to be compared.

Sample Input:

5 4

12865

26810

Sample Output:

1 5 10

3

Sample Input:

55

12345

12345

Sample Output:

NO SUCH ELEMENTS

For example:

Input					Result
5	4				1 5 10
1	2	8	6	5	3
2	6	8	10	9	
5	5				NO SUCH ELEMENTS
1	2	3	4	5	
1	2	3	4	5	

Answer: (penalty regime: 0 %)

```
k=input()
k1=k.split()
m=input()
m1=m.split()
n=input()
n1=n.split()
1=[]
for i in m1:
   if i not in n1:
        l.append(i)
for j in n1:
   if j not in m1:
       1.append(j)
if len(1)>1:
   for j in 1:
       print(j,end=" ")
    print("\n",len(l),sep="")
else:
```

	Input	Expected	Got	
~	5 4 1 2 8 6 5 2 6 8 10	1 5 10 3	1 5 10 3	~
~	3 3 10 10 10 10 11 12	11 12 2	11 12 2	~
~	5 5 1 2 3 4 5 1 2 3 4 5	NO SUCH ELEMENTS	NO SUCH ELEMENTS	~

Passed all tests! \checkmark

Correct

Marks for this submission: 1.00/1.00.

```
Question 5
Correct
Mark 1.00 out of 1.00
```

The **DNA sequence** is composed of a series of nucleotides abbreviated as 'A', 'C', 'G', and 'T'.

• For example, "ACGAATTCCG" is a DNA sequence.

When studying **DNA**, it is useful to identify repeated sequences within the DNA.

Given a string s that represents a **DNA sequence**, return all the **10-letter-long** sequences (substrings) that occur more than once in a DNA molecule. You may return the answer in **any order**.

Example 1:

```
Input: s = "AAAAACCCCCCAAAAAAGGGTTT"
Output: ["AAAAACCCCC", "CCCCCAAAAA"]
```

Example 2:

```
Input: s = "AAAAAAAAAAA"
Output: ["AAAAAAAAAAA"]
```

For example:

Input	Result
AAAAACCCCCAAAAACCCCCCAAAAAAGGGTTT	AAAAACCCCC CCCCAAAAA

Answer: (penalty regime: 0 %)

```
s=input()
if len(s)<11:
    print('[]')
sequences={}
repeated_sequences=set()
for i in range(len(s)-9):
    sequence=s[i:i+10]
    if sequence in sequences:
        repeated_sequences.add(sequence)
    else:
        sequences[sequence]=1
d=list(repeated_sequences)
for i in d:
    print(i)</pre>
```

	Input	Expected	Got	
~	AAAAACCCCCAAAAACCCCCCAAAAAGGGTTT	AAAAACCCCC CCCCAAAAA	AAAAACCCCC CCCCAAAAA	~
~	AAAAAAAAAAA	AAAAAAAAA	AAAAAAAAA	~

Passed all tests! 🗸

Correct

Marks for this submission: 1.00/1.00.
